# Looking for a Pattern in Antenna Design

Sean Edwards

RF Designer

# What pattern are you looking for?

- Polarization:
  - Horizontal
  - Vertical
  - Circular
  - Elliptical
- Omni
- Somewhat Directional
- Very Directional
- Multi-lobed Directional
- Null Fill or Beam Tilt

# Basic Equations and terms we will reference during the presentation

Polarization, Axial Ratio and Rotation

Wavelength ( $\lambda$ )

Far Field, Power Density and Field Strength (dBu)

Elevation patterns of Isotropic point sources which define Array Factors

Prove that  $\frac{1}{2}$  wave spacing has maximum reduction in downward radiation

Show how bay to bay spacing effect downward radiation

# It All Starts with the Dipole

Vertical  $\frac{1}{2}\lambda$  Dipole in free space

# $\frac{1}{2}\lambda$ Dipole Fields

The H fields form at the current maxima and the E fields form at the voltage maxima

# The electric field lines of a $\frac{1}{2}\lambda$ Dipole at four moments in time.

At  $t=0$   
Antenna Current is zero, and the charge at the ends of the dipole  
is a maximum

"Electromagnetics" John D. Kraus

1/8 of a period later the current has started to flow

At  $t=1/4$  the current has reached its peak value,  
and the charge at the ends is zero.

“Electromagnetics” John D. Kraus

At  $t = 3/8$  the current continues to flow but at a reduced magnitude. And then the cycle repeats for the second half-cycle but with the signs reversed.

“Electromagnetics” John D. Kraus

# 3D Dipole “donut” Pattern

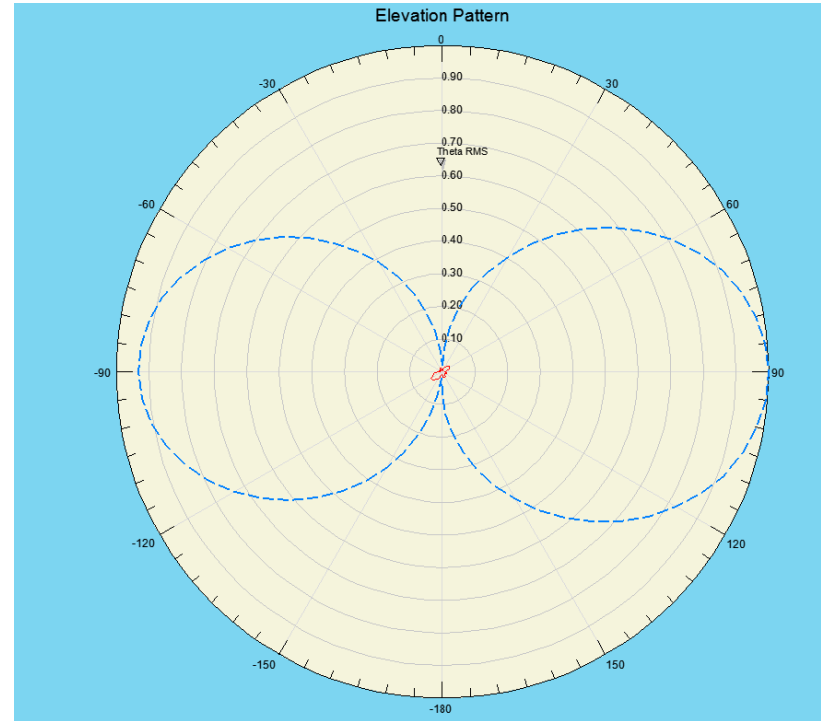

in this case vertically polarized

# Dipole Pattern in 2D

Azimuth “slice”

Elevation “slice”

# Polarization, Axial Ratio, and Rotation (RHCP or LHCP)

$$AR = \frac{OA}{OB} \quad (1 \leq AR \leq \infty)$$

$$\mathbf{E} = \hat{x}E_1 \sin(\omega t - \beta z) + \hat{y}E_2 \sin(\omega t - \beta z + \delta)$$

where  $E_1$  = amplitude of wave linearly polarized in  $x$  direction  
 $E_2$  = amplitude of wave linearly polarized in  $y$  direction  
 $\delta$  = time-phase angle by which  $E_y$  leads  $E_x$

If  $E_1 = 0$ , the wave is linearly polarized in the  $y$  direction.

If  $E_2 = 0$ , the wave is linearly polarized in the  $x$  direction.

If  $\delta = 0$  and  $E_1 = E_2$ , the wave is also linearly polarized but in a plane at an angle of  $45^\circ$  with respect to the  $x$  axis ( $\tau = 45^\circ$ ).

If  $E_1 = E_2$  and  $\delta = \pm 90^\circ$ , the wave is circularly polarized. When  $\delta = +90^\circ$ , the wave is *left circularly polarized*, and when  $\delta = -90^\circ$ , the wave is *right circularly polarized*.

“Electromagnetics” John D. Kraus

# How to Calculate Wavelength

$$\lambda = \text{Speed of light} / \text{Frequency}$$

Speed of light = 299,792,458 m/sec

39.371 inches = 1 Meter

$$299,792,458 \times 39.371 = 11803 \times 10^6$$

$$11803 \times 10^6 / 1 \times 10^6 = 11803$$

$$\lambda = 11803 / 98.1 = 120.3''$$

# Far Field

$$\equiv r = 2D^2 / \lambda$$

5 Bay @ 98.1 MHz

$$\lambda = 11803 / 98.1 = 120.3 \text{ inches} \approx 10 \text{ Feet}$$

$D$  = Length of Antenna = 40 Feet

$r$  = Distance to Far Field

$$r = 2 D^2 / \lambda = 2 (40)^2 / 10 = 320 \text{ Feet}$$

$$\text{Surface Area} = 4 \pi R^2$$

$$\text{Power Density} = S$$

$$= P / 4 \pi R^2 = \text{Watts} / \text{Meter}^2$$

# Calculating Field Strength

100 kW at a distance of 30 Kilometers ( $\approx$  20 Miles)

$$\text{Power Density} = S = P / 4 \pi R^2$$

$$S = 100,000 \text{ Watts} / 4 \pi (30,000 \text{ Meters})^2$$

$$S = 0.0000088 \text{ Watts} / \text{Meter}^2$$

$$S = 8.8 \times 10^{-6} \text{ Watts} / \text{Meter}^2$$

## Calculate Electric Field from Power Density

$$E = \sqrt{S \times Z_0} = \sqrt{8.8 \times 377} = 58 \text{ millivolts} / \text{meter}$$

$$E \text{ in dBu} = 20 \log E / 1 \times 10^{-6} = 20 \log 58 \times 10^{-3} / 1 \times 10^{-6}$$

$$E = 95 \text{ dBu}$$

# 6016 CP Panel

Consists of 2 sets of dipoles  
1 set is vertically oriented and 1 set is horizontally oriented  
 $\delta = -90$

# 6016 Panel

rearview showing the surface currents on the front of the panel (RHCP)

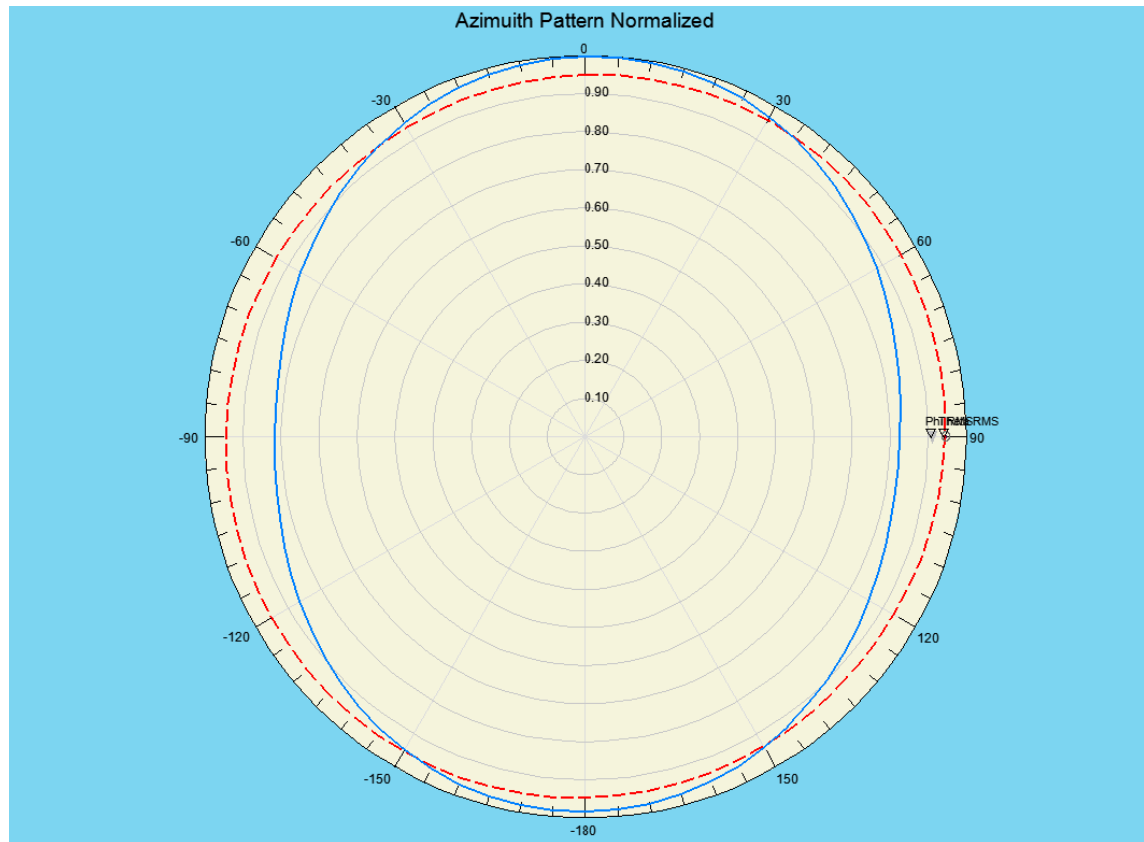

# Ring Stub (6812)

The next logical progression. Produce both Vertical and Horizontal components from one element.

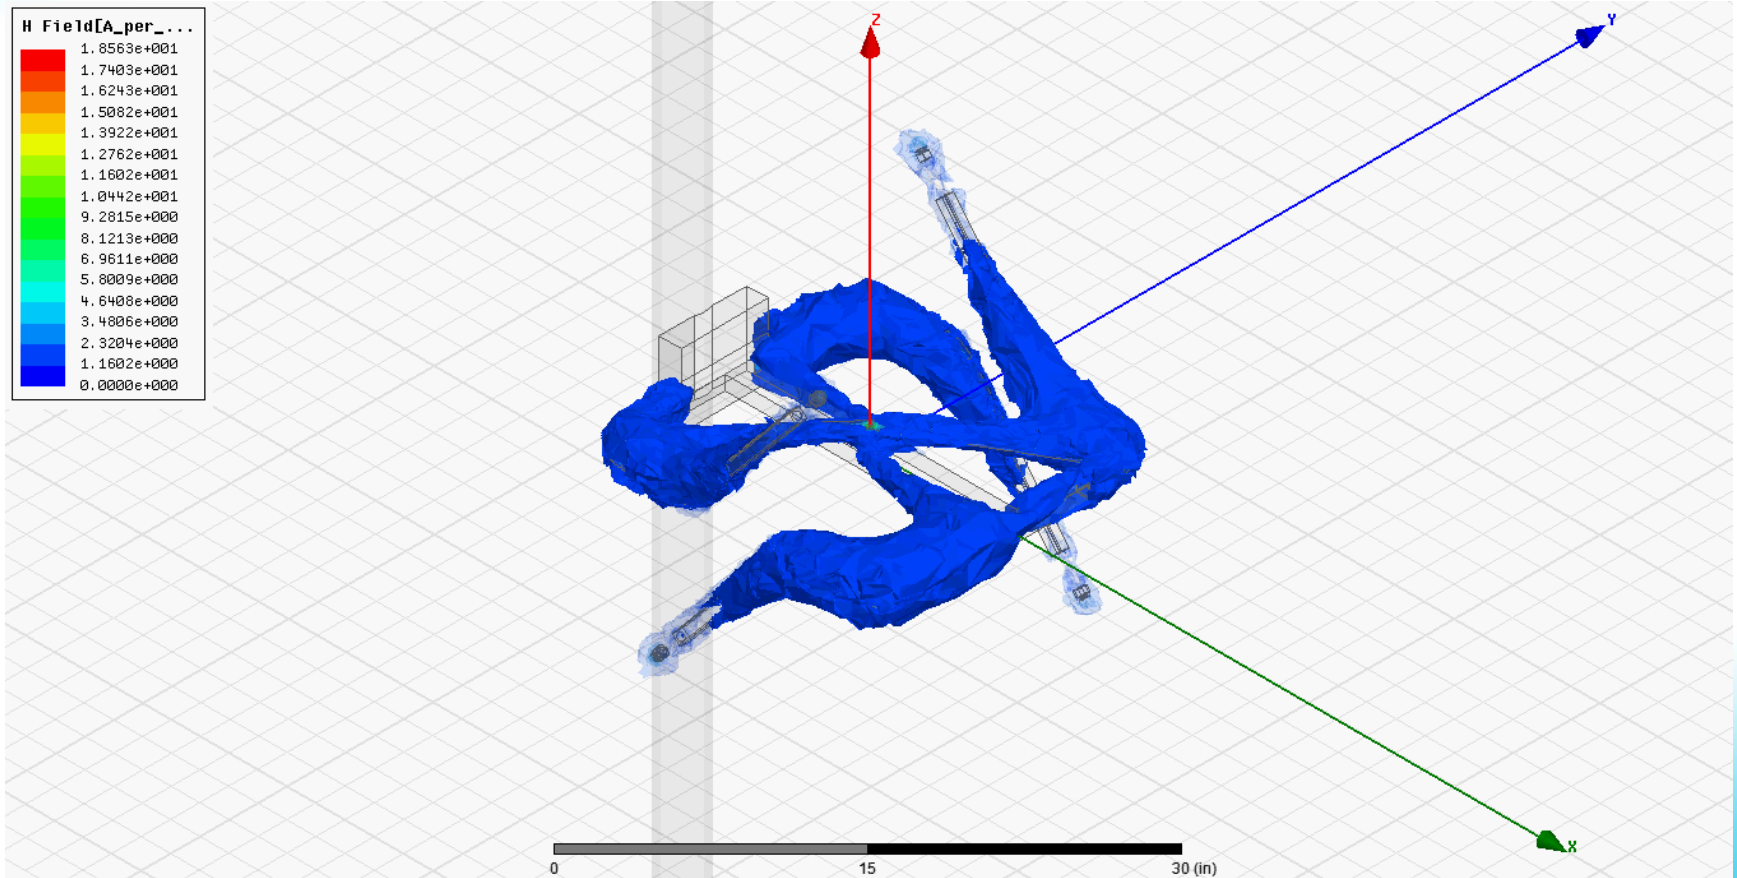

6812B produces a nice CP pattern  
albeit a bit oblong in the horizontal polarity

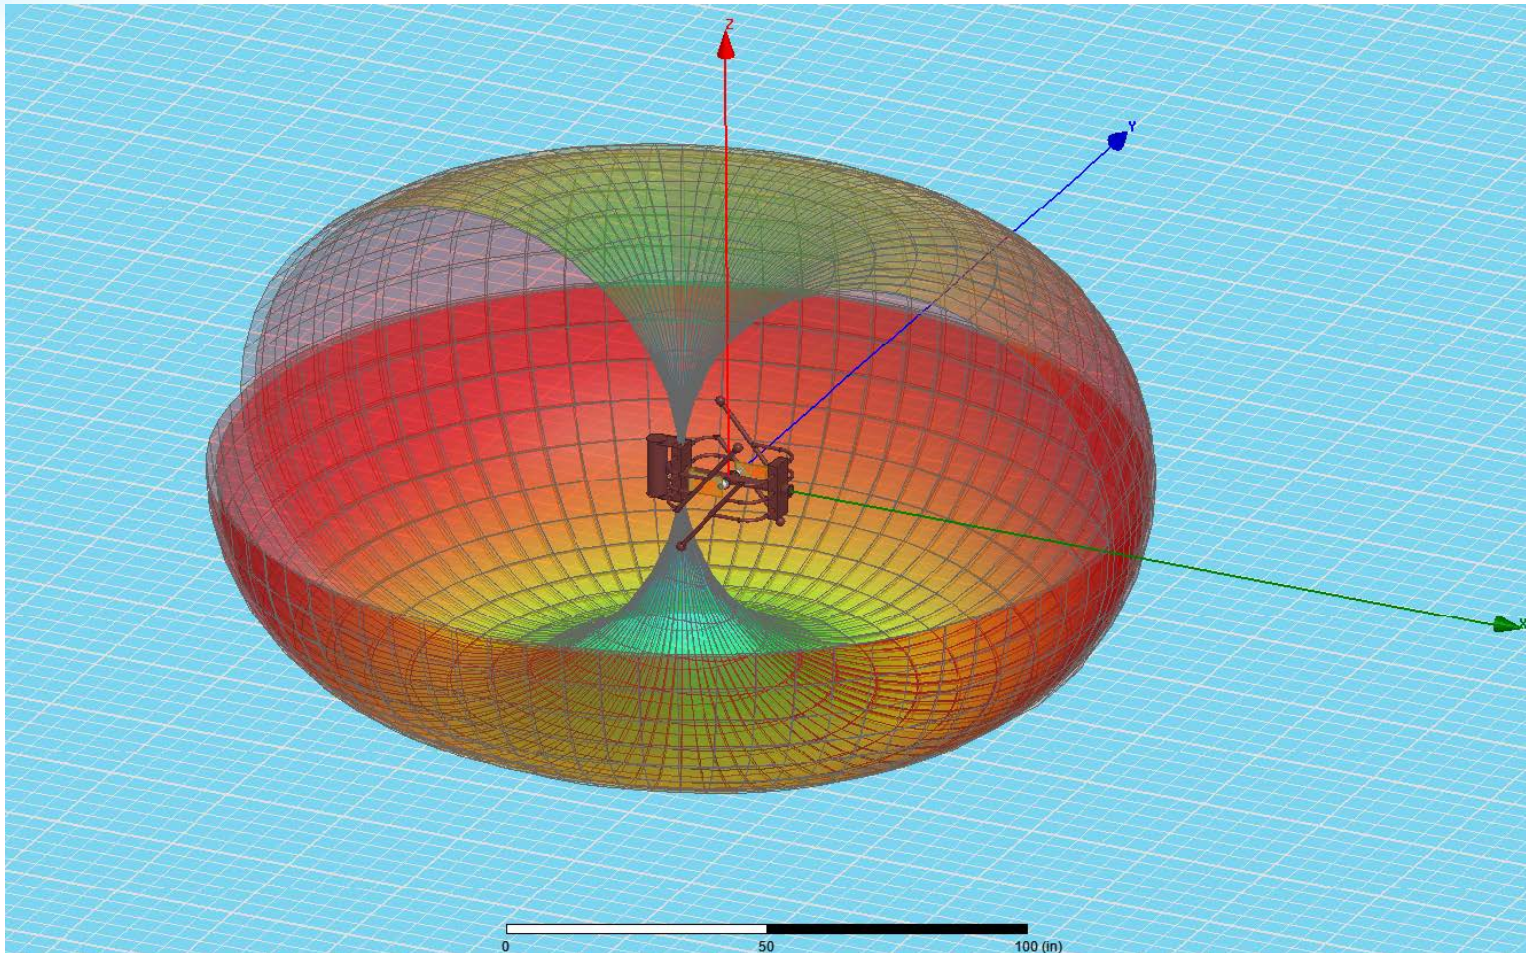

# SLV Fields

This variation is more complex still. Notice that now there are 2 dipoles, back to back sharing the same ground plane. This enhances azimuth circularity.

# 6814 in Free Space

SLV derived from our model 6814 SHP Antenna

# 6814 on Pole

Now the vertically polarized field is effected by the vertical mounting structure

Notice the forward push to the vertical component

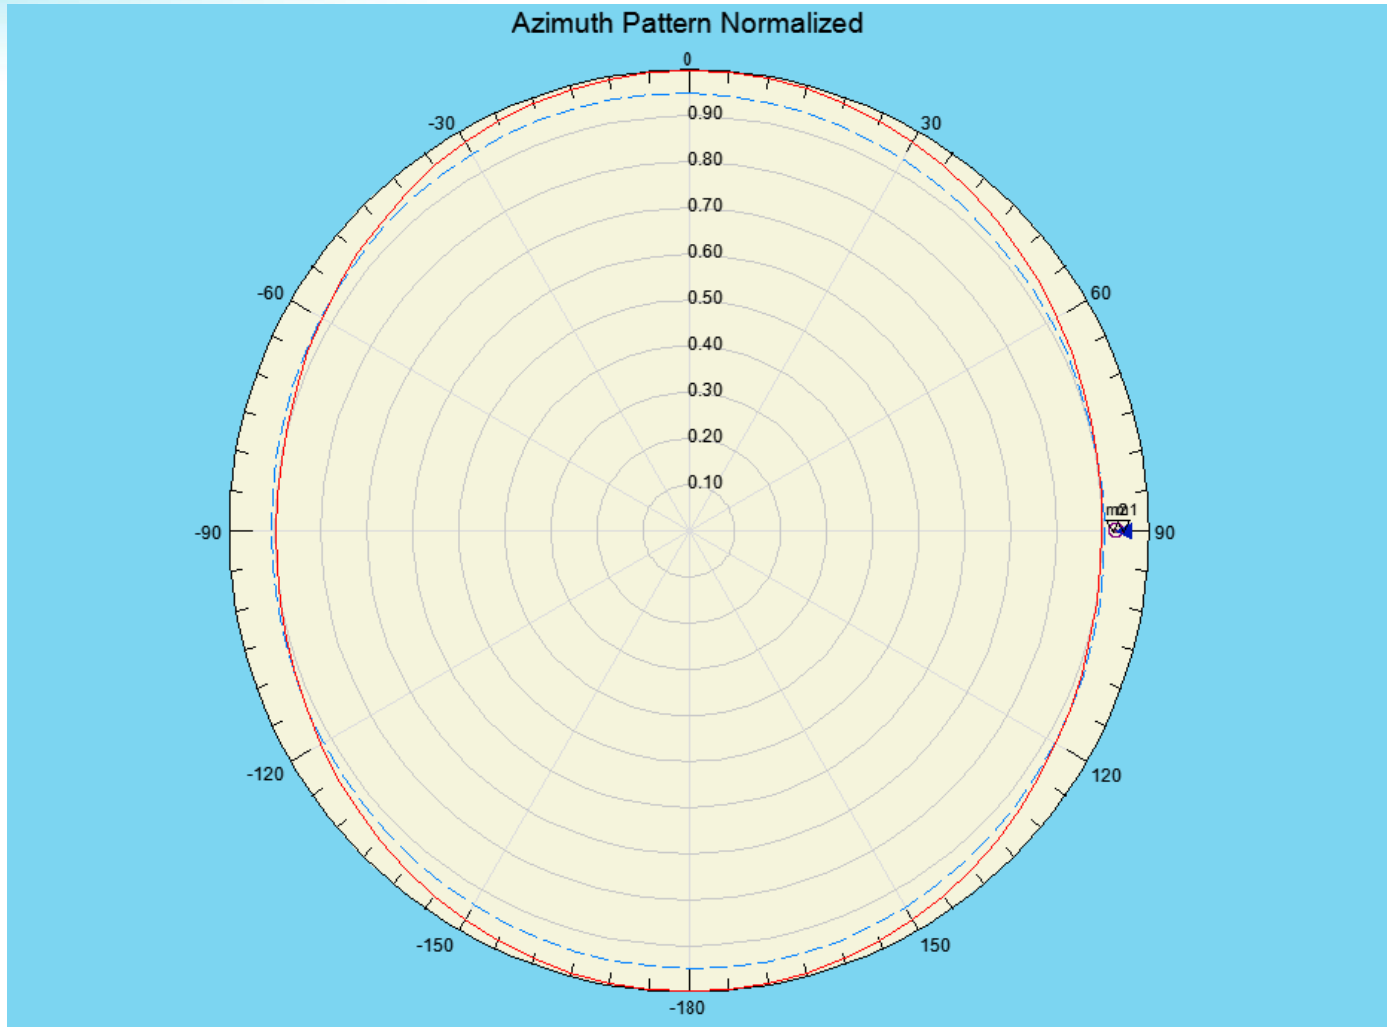

# SLV Free space

Again we are starting with a classic “donut” pattern,  
but now distributed among both the vertical *and* horizontal polarity

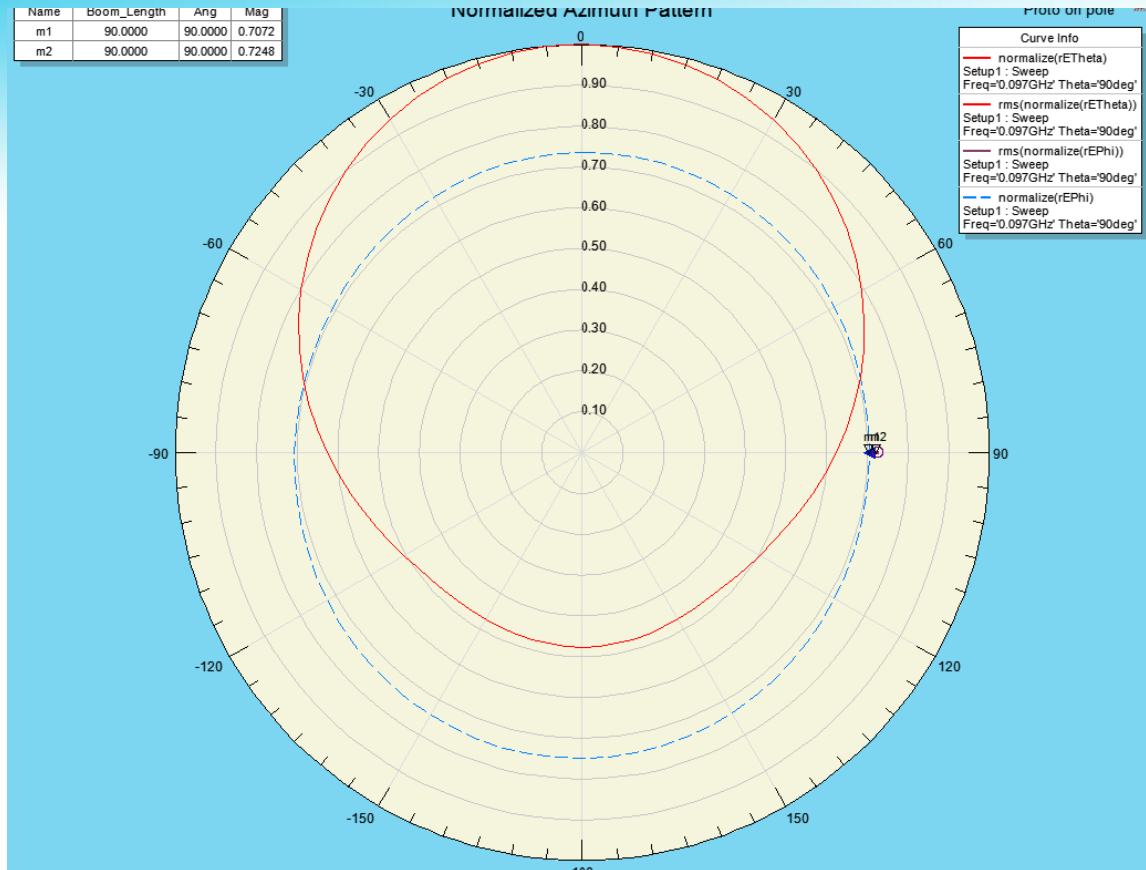

# SLV Free space

The azimuth circularity on the horizontal component has improved over the 6812

# SLV Versa2une on pole

## SLV “Versa2une” on a pole

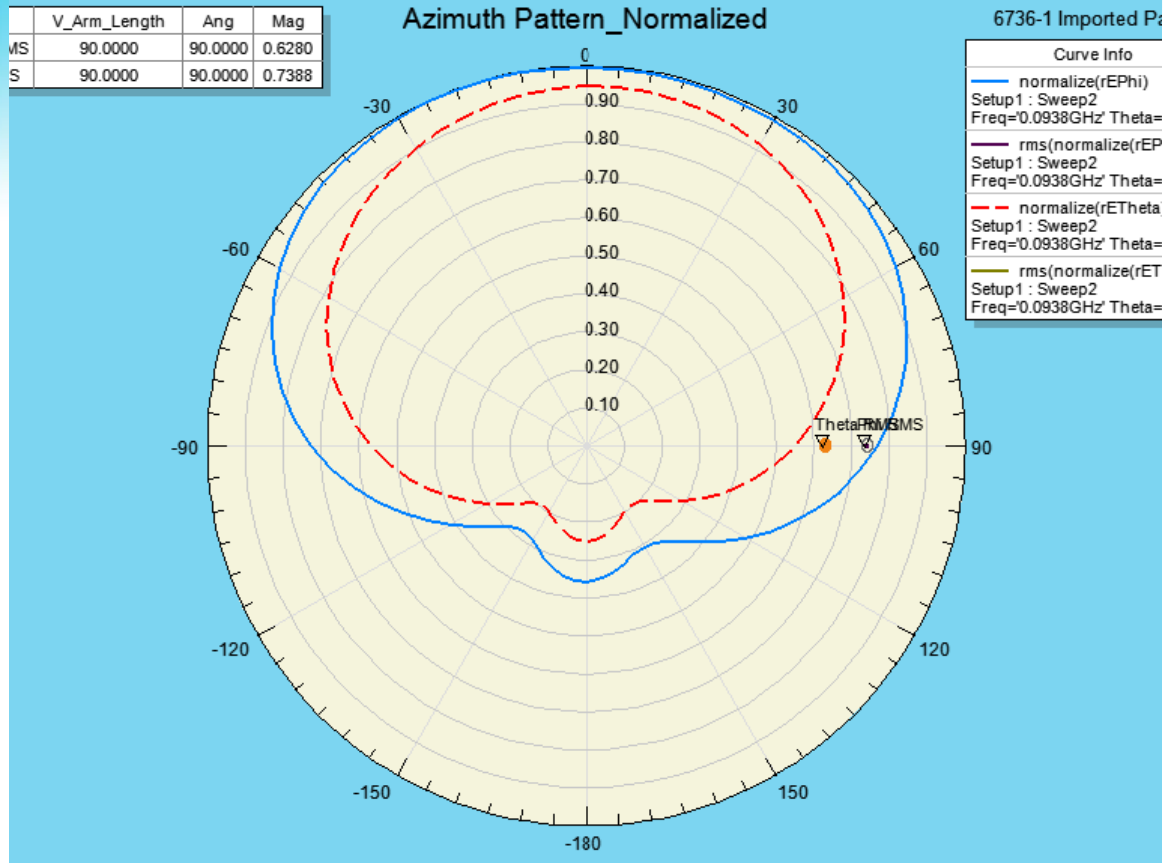

Again note how the vertically polarized energy is “pushed” forward

### SLV-1-DA

## 2 leg pick-up with Bent Horizontal Parasitic Element

Through a process of optimization various directional patterns are realized and cataloged.

## SLV Directional Pattern

Here is one example a directional pattern

## SLV on Water Tower

This analysis was done to determine the water tower's effect on the antennas reflected power but in the process we obtain the resulting radiated pattern which was in step with the local engineer's observations.

# Questions

## 6025 Log Periodic Antenna

Building block for highly directional sites and multi-lobe patterns

# 6025 in 4 successive orientations

## 6025 Horizontally Polarized

The Half Power Beam Width (HPBW) is about 60 degrees

## 6025 @ 50 DEGREES

Now the RMS values are equal but the peaks are not.

## 6025 @ 45 Degrees

The peaks are equal but the RMS value is not

## 6025 Vertically Polarized

HPBW is about 100 degrees

# 6025 Log Periodic antennas are versatile

Special H/V ratios

## SHIVELY LABS SAMPLE PATTERN

**6025 DUAL BOOM 60-INCHES APART**  
**6025'S 30-DEGREE ROTATION POWER SPLIT 75-V 25-H**

**VERTICAL RMS: 36.70%**

**HORIZONTAL RMS: 21.02%**

PATTERN NUMBER	6025-014
FREQUENCY:	<b>BROAD BAND</b>
ANTENNA AZIMUTH	0-Degrees
TOWER	POLE
MOUNT STYLE	CUSTOM
MOUNT REMARKS	CALL SALES
DISTANCE FROM TOWER	N/A

This is a custom mount  
Dual 6025's mounted on boom spaced 60-inches apart  
Changing spacing will affect pattern shape  
6025's orientated @ 30-Degrees  
Contact Sales for design details & cost  
Radomes are optional  
Pattern studies are optional  
Shively Labs recommends anti-rotation brackets

**Shively Labs®**  
A Division of Howell Laboratories, Inc.

## 2 Log Periodic antennas 60 inches apart

By placing elements side by side we can control the HPBW and by rotating achieve EP.

### SHIVELY LABS SAMPLE PATTERN
